

PHP Invoicing System

Without using a PHP framework or third party packages of any sort, build a PHP application that connects to the provided database and allows it's users to perform the following tasks:

- List the invoices from the database table into an HTML paginated table, having 5 records per page.
- Export the transactions as a CSV file. The export should be in the following format:

Invoice ID	Company Name	Invoice Amount
------------	--------------	----------------

- Export a CSV customer report. The export should be in the following format:

Company Name	Total Invoiced Amount	Total Amount Paid	Total Amount Outstanding
--------------	-----------------------	-------------------	--------------------------

- Set the payment status of each invoice via the interface to paid / unpaid

Note:

- Front end frameworks may be used, such as Bootstrap or Foundation.
- PSR coding standards is recommended.
- Adding any additional fancy features would be a bonus.

Once complete, upload the project onto GitHub, and include a readme, formatted in markdown, containing instructions on how to install and run the application.
